START HERE

Using your Admin manual

A dedicated guide for authorized administrators.

Edition and release scope
Prepared 4 November 2026 for the current local customer-login application. Recent features described here are local changes, not proof of deployment. Confirm the matching release before production use.

Access	Address / purpose
Production portal	https://gstreturns.primeserve.in/ - use when the matching release is deployed.
Local testing	http://127.0.0.1:8086/ - only on the computer running the local server.
Your workspace	/admin for separate authorized Admin sign-in and controls.

Who this manual is for

This guide explains customer access, billing modes, prices, wallet corrections, bank-verified approvals, manual refunds and reporting. Use only your authorized Admin account. Customer registration and GST-service procedures are documented separately in the User Manual.

How to use the steps

Open a heading to expand its controls. Follow the numbered instructions and read the success/error popup. Table dates use Indian Standard Time (IST), including both dates in a range. Amounts are INR. Current client rates and price confirmation determine the payable charge.

Safe handling
Keep this Admin Manual within authorized staff. Business actions and email-delivery status are different; a failed email does not necessarily undo a saved access or money change.

ADMIN GUIDE

Navigation and daily routine

One workspace for access, approvals, pricing and reports.

Heading	Main controls
Home	Overview counts, configuration flags, shortcuts and promotional-credit total.
Customers	Block/unblock, billing type and terms, current billing GST, customer registry.
Payments	Wallet grants/corrections, recharges, refunds, held API charges, postpaid payments.
Pricing	Standard prices, special client rates, service access, bonus history.
Reports	Date/client Excel exports with large-report splitting.
Settings	Bonus, payment/supplier-state settings, prepaid key and delivery/audit lists.
API Activity	Client IP, operation and HTTP/status outcome; separate from the home overview.

1. Sign in through **/admin** using privately provided authorized credentials. No password is included here.

2. Review configuration flags, pending payments, open refunds and uncertain API charges.

3. Verify bank/source facts before recording a decision. Read the saved-success popup and refresh the list.

4. Export relevant reports for reconciliation and log out when finished.

> **Recent rows are not the full ledger**
> Dashboard/section lists and section exports generally contain up to 50 recent records. Customer selection retains the registry so any client can be managed. Use Reports for complete date-range exports.

Account access and service permissions are different. Blocking prevents portal login; disabling a client service restricts that API. Neither is a substitute for resolving financial holds.

ADMIN GUIDE

Assign billing mode and credit

Only Admin decides PREPAID or POSTPAID arrangements.

1. Open **Customers > Prepaid / Postpaid & Credit Limit**. Search by name, company, email or mobile.

2. Select the exact customer and review current mode, balance and outstanding records.

3. Choose PREPAID or POSTPAID. For postpaid, enter approved credit limit in rupees and terms in days (1-365).

4. Select **Save customer billing**. Mode changes end existing customer sessions and require a new login.

5. Ask a postpaid customer to enter the current API key once after that login. Prepaid uses the backend key.

Changes	Stays preserved
Dashboard cards and new-request funding method	Wallet ledger, usage, historical prices and tax snapshots.
Sessions when billing mode changes	Customer identity and audit history.
Postpaid available credit/terms	Old postpaid outstanding and old prepaid balances.

Open refund restriction
Resolve pending/approved wallet refunds before changing billing mode. Do not switch mode to bypass a hold.

Credit limit is not a payment

Increasing credit permits more consumption; it does not settle debt. A verified postpaid payment uses the separate Payments form. Reducing the limit below outstanding may leave no available credit but does not erase outstanding.

The Account enabled display in this form reflects status. Use Block / Unblock Customer to change access with a reason and status email. The customer cannot choose billing mode, credit limit, terms or their API prices.

ADMIN GUIDE

Block, unblock and edit GST details

Control access without deleting financial history.

Block a customer

1. Open **Customers > Block / Unblock Customer** and select the correct account.

2. Choose **Block account** and enter a clear 5-300 character reason. It is customer-facing; do not put confidential internal notes in it.

3. Select **Save account access**. Login is disabled and all customer sessions and temporary API keys are revoked.

4. An active portal page returns to Login on its next heartbeat, normally within about 5 seconds while active, or when reopened. Already dispatched requests cannot be recalled.

Unblock

Use the same form, select **Unblock account**, enter the reason and save. The customer may log in again with existing credentials. Old sessions do not revive. Balances, rates, usage and payments remain unchanged.

Login message and email

Correct login credentials on a blocked account show "blocked by Admin" with the reason. Wrong credentials retain the generic error. Both block/unblock status changes email the customer with status and reason. Admin sees accepted-for-sending or failure; repeated no-change saves do not send duplicates.

Current billing GST

Under **Customer Billing GST Details**, select the client and choose Save / Edit or Delete. Enter current state/GSTIN as appropriate and save. Old usage tax snapshots remain unchanged.

> **Two GSTIN fields**
> Billing GSTIN identifies the customer for billing. Request GSTIN identifies the taxpayer actually queried. Use request GSTIN in API investigations; do not substitute the billing GSTIN.

ADMIN GUIDE

Standard and special client prices

Global updates leave protected rates and past charges untouched.

Change standard rates

1. Open **Pricing > Standard Service Prices** and choose a service.

2. Review the current before-GST price, enter the new amount and select **Update standard price**.

3. The popup reports saved status and affected clients. Existing and new standard-rate clients use it for future requests.

Edit a client rate

1. Search **Client Pricing** and choose the row's **Edit** button to populate Customer API Prices & Access.

2. Choose **Special fixed rate**, enter the agreed price, review Service enabled and select **Update fixed price**.

3. To follow global pricing again, choose **Standard rate** and save. This adopts the current standard and later changes.

Example	Effect
Standard return price ₹3 becomes ₹4	Standard clients move to ₹4 before GST for future requests.
A client has special ₹2.50	Remains ₹2.50 until Admin edits/resets it.
Special equals the old standard	Still protected; equality does not make it standard.
Service is disabled	Rate changes do not enable it automatically.

Per client, per service
One service can be standard and another special for the same customer. Migration conservatively protects explicit Admin assignments and ambiguous legacy rates differing from the default. Deliberately reset them if standard pricing is intended.

Edits are audited. Historical charges never change. A customer's stale price confirmation may need review before another request. Rates exclude GST in Admin; the confirmation adds applicable tax.

ADMIN GUIDE

Signup bonus and permissions

Manage promotional awards separately from bank credits.

1. Open **Settings > Default Prices, Bonus & Payment Settings**.

2. Choose **Bonus Active (1) / Inactive (0)**; enter 1 or 0 and save.

3. Choose **Signup Bonus (₹)** to change the award for future eligible verified registrations. Original default: ₹30.00.

4. Review Signup Bonus History and promotional total; use Reports for dated/client exports.

Who gets the bonus

Only new customers finalizing verified registration while the offer is active qualify. Eligibility is checked at verification completion, not just OTP initiation. Duplicate identities and repeat awards are prevented. Existing users do not receive retroactive credit after reactivation.

Bonus is not cash received
Previously awarded promotional credits remain unless a separate disclosed policy is introduced. They can fund eligible services but are not refundable paid credits. Never approve a cash refund from a bonus total.

Client service permission

Open **Pricing > Customer API Prices & Access**, choose client/service, review mode and price, set **Service enabled** and save. Disabling that service does not delete the customer or disable all other APIs.

Restriction	Effect
Account blocked	No portal login; requires Admin unblock.
Service disabled	That client/service is not enabled.
Wallet/credit insufficient	Paid request cannot be funded.
Consent withdrawn	GST services paused; account/refund access retained.

ADMIN GUIDE

Wallet grants and corrections

Keep adjustments, received payments and refunds separate.

Give an authorized credit

1. Open **Payments > Add Balance to Customer Wallet**.

2. Select the prepaid client, enter a positive amount and clear reason. Maximum per grant/correction: ₹10,00,000.

3. Choose **Add balance**, read the popup and check the ledger. The customer is notified once.

Correct an incorrect credit

1. Open **Reduce Wallet Balance / Correct Wrong Credit** and select the client.

2. Enter the positive amount to subtract and a specific correction reason.

3. Tick that you checked customer and amount; select **Reduce balance**.

4. Verify balance, negative admin-debit entry and audit. The customer is notified of the reason.

Action	Use
Recharge approval	An actual customer bank payment was independently verified.
Admin credit	An authorized grant/adjustment, not a bank receipt.
Admin debit	Correct available wallet balance; no money is transferred externally.
Refund	Return eligible unused paid funds through separate review/manual transfer.

Protected funds
No negative balance is allowed. You cannot subtract more than available funds or consume API/refund holds through a correction. Duplicate adjustment references cannot apply twice. Postpaid credit and payment controls are separate.

Original bank/usage history remains preserved. Explain the mistaken entry rather than altering old receipts to hide an adjustment. Check the customer's actual balance after saving.

ADMIN GUIDE

Approve or reject a recharge

A typed UTR is a claim, not verified proof of receipt.

1. Open **Payments > Approve or Reject a Recharge**. Select the pending request and identify customer, amount and UTR.

2. Independently inspect the business bank/UPI account. Match reference, amount, recipient and successful receipt. Do not rely on screenshots alone.

3. If verified, choose **Approve payment**, tick bank verification, enter a reason and **Record decision**.

4. If unverified/incorrect, choose **Reject payment**, enter the reason and save. Do not approve merely to clear a pending list.

5. Check the paid-recharge ledger and Recharge History. The same request cannot credit the wallet twice.

Notifications and tax

The customer receives the result. Company notices distinguish a submitted claim from an independently confirmed receipt and include customer identity and amounts. Intended recipients are **primeserve45@gmail.com** and **finance@primeserve.in**, with the configurable allowed address managed in Settings. info@primeserve.in is excluded as a recipient.

The top-up carries ₹0 additional GST in this portal; API consumption attracts GST separately. A payment acknowledgment is not a consumption invoice. Do not add another 18% to the verified top-up.

> **No pending item visible?**
> Confirm the customer submitted amount and UTR after paying. Check Recharge History and full dated Reports because recent lists are limited. Refresh. A bank transfer alone does not create the portal request.

Use Primeserve Payment Email Status and Email Delivery Acceptance Status for notification problems. Accepted means accepted for sending, not guaranteed inbox delivery. Do not approve the payment again to resend an email.

ADMIN GUIDE

Review and pay a refund

Two stages: decide the amount, then transfer and record it.

Stage 1 - Portal request plus mandatory email

1. Open **Payments > Refund Requests - Review**. Read the request table for customer name/email/company, reason, amount and refund UPI.

2. Match a separate customer email with complete details and a valid reason at **support@primeserve.in**, quoting the portal ID. Both steps are mandatory.

3. Check original paid credits, usage/corrections/holds and eligible remaining funds. Exclude bonuses and Admin grants.

4. Choose approval or rejection. Enter the final amount (no more than requested; 0 for rejection) and review reason. Approval requires the email-received confirmation.

5. Choose **Save refund decision**. Partial approval releases the unapproved amount; rejection releases the full hold.

Stage 2 - Manual transfer

1. Manually send only the approved amount using the business bank/UPI system to the verified destination. The portal does not send money.

2. After independently checking transfer success, open **Refunds - Record Manual Transfer** and select the approved request.

3. Enter the UTR/bank reference, tick transfer-success confirmation and **Mark refund paid**. The wallet is not deducted again.

> **Partial refund example**
> Customer requests ₹100; Admin approves ₹70. ₹30 returns to available wallet, ₹70 remains held, and Admin manually sends ₹70. Mark Paid only after successful transfer.

No automatic refund emails are sent. The customer personally sends the support email and monitors status in My Account. Use date/client refund reports. Refund holds have no automatic expiry; follow up unresolved cases. No completion time is promised before review.

ADMIN GUIDE

API holds and postpaid payments

Verify uncertain outcomes before charging again or releasing money.

Resolve a held API charge

1. Open **Payments > Review Held API Charges**. Cross-check customer, service, actual request GSTIN, period, request/job ID and provider outcome.

2. Choose **Charge accepted request** for a verified billable outcome, or **Release reservation** for a verified non-billable rejection.

3. Enter review evidence/reason and select **Resolve reservation**. Verify wallet/outstanding and usage records.

Usage status	Meaning
reserved	Authorized funds held pending outcome.
charged	Finalized billable request.
released	Reservation reversed; available wallet/credit restored as applicable.
review	Uncertain provider result requiring verification.

Record a postpaid payment

1. Select the customer in **Payments > Record Postpaid Payment** and verify bank receipt.

2. Enter the amount in rupees and bank reference, tick independent receipt verification and record it.

3. Check that outstanding reduced. A duplicate reference cannot settle twice; this form does not accept an amount exceeding outstanding.

> **Do not retry blindly**
> A timeout can follow provider acceptance. Check before releasing funds or requesting again. A status-poll retry differs from a chargeable new initiation. A wallet correction is not a substitute for reviewing an uncertain API outcome.

Use full Reports for reconciliation. Read actual request GSTIN rather than substituting profile billing GSTIN. Historical charge records remain intact when client details or rates change.

ADMIN GUIDE

Reports and large Excel exports

Select date range and client instead of relying on recent rows.

1. Open **Reports > Download Excel Reports**.

2. Choose Refund Requests, Payments & Recharges, Customer Details, API Usage & Charges, Wallet Transactions or Signup Bonus Credits.

3. Choose one customer or **All customers**. Set From and To dates; both endpoints are included in IST.

4. Select **Download Excel**. Check report type, dates and client before using it for reconciliation.

Where / size	Behavior
Section Download Excel	Up to 50 recent records, with the section search filter.
Dated report up to 100,000 rows	One Excel workbook.
Dated report over 100,000 rows	One ZIP containing numbered Excel parts, up to 100,000 data records each. Extract and review all parts.
Over 100,000 records in one day	Set From and To to the same day. The split result covers that full selected day/client, not just the first 100,000.

Search and date semantics

Search selectors by name, company, email or mobile. Section search covers its recent scope; an absent row may still exist in full Reports. Customer Details uses registration date. Other reports use transaction/request-created date; a refund reviewed later may belong to its earlier creation date.

Identity in usage exports

Customer name/email/company, request GSTIN, return type and period are included where captured. Older missing request context can be blank or Not recorded. Do not fabricate it from billing details.

> **Protect the exports**
> Workbooks contain personal/financial information. Restrict access and save securely. Refund exports exclude the encrypted destination; authorized Admin can view UPI in the portal. Local downloaded copies are not removed by portal retention.

ADMIN GUIDE

Settings, GST and API keys

Keep secrets on the backend and verify payment changes.

Setting	Purpose / caution
UPI ID / Payee Name	Controls QR/payment details. Verify the destination before asking customers to pay.
Payment Notification Email	Use intended finance recipient. The configured allowed address is combined with the specified Primeserve Gmail recipient. info@primeserve.in is excluded.
Supplier State Code	Confirmed Primeserve state: 10. Customer state determines same-state or interstate split on future usage.
Default prices	Follow standard/special behavior; prefer the dedicated Pricing form.
Bonus status / amount	Controls future eligible verified registrations only.

Rotate the prepaid key

1. Open **Settings > Prepaid API Key Management**.

2. Enter a new valid key in the password field and choose **Rotate key**.

3. Read the saved popup. Full stored key values are not returned to this dashboard.

4. Coordinate with provider access; a wrong key can stop prepaid requests. Never paste it into reports, email or customer screenshots.

Tax snapshots

Usage records taxable value, 18% GST, total and CGST/SGST or IGST based on billing states. Changes affect future transactions, not historical tax snapshots. A usage workbook does not automatically constitute a statutory tax invoice.

Server-only email credentials
Zoho agent alias, verified sender and send-mail credential belong in secure server configuration. The token is not the DKIM public key and is not shown in Admin. Ask the technical maintainer for changes; never commit secrets to GitHub.

ADMIN GUIDE

Email, API activity and audit

Separate business status from email-delivery acceptance.

Notification	When / recipient
Registration OTP	To registering email; verification is mandatory.
Welcome / bonus / new customer	Welcome/eligible bonus to customer; new registration alert to primeserve45@gmail.com.
Password reset / confirmation	Customer reset process and completion notice.
Recharge / company payment	Customer acknowledgment/result; company submission and receipt notices to allowed recipients.
Wallet correction / client update	Applicable customer account-change notice.
Block / unblock	Customer status and Admin reason on actual access change.
Low balance	Worker sends a prepaid reminder once per low-balance episode. Default threshold ₹10; configurable.
Refund request	No automatic email. Customer must separately email support; Admin manually reviews/transfers.

Where to investigate delivery

Check Email Delivery Acceptance Status and Primeserve Payment Email Status. Queued/sending, accepted, failed or review states describe delivery handling. Accepted is not inbox confirmation. Check address/spam and configuration. Do not repeat a money action to generate another email.

API Activity

Review originating client IP, API/return, method/endpoint, HTTP/outcome and duration where captured. IP depends on trusted proxy configuration and is not proof of a person's identity. Customer-mode keys, OTPs and signed file URLs are excluded from retained logs.

Account & Billing Audit records changes and reasons. A status email failure does not reverse a saved block or financial change. First verify actual account/business status, then investigate the notification.

OPERATIONS

Privacy and retention in daily use

Consent withdrawal, account block and refund are separate actions.

Item	Effect / retention
Consent withdrawal	Customer self-service, no Admin approval. GST access pauses; saved connections removed. Account/refund access remains.
Consent again	Customer can opt in again without Admin. A new GST connection may be needed.
Account block	Admin denies login and revokes sessions; balances/history retained.
Return files / job records	10 minutes after first successful browser download confirmation; separate 24-hour limit for undownloaded work.
Challan / certificate response	Short-lived delivery response; browser clears after 10 minutes or service switch. Save locally.
API activity	Default 30-day retention for content-free activity.
Financial / consent records	Separate retention for administration, evidence and applicable obligations; not deleted by the 10-minute timer.

Escalate operational issues

Worker offline, repeated source timeouts, unavailable email verification, broken downloads, configuration errors, backups or deployment differences belong with the technical maintainer. Provide safe diagnostics; do not hide a fault with balance changes.

> **Already dispatched requests and saved copies**
> An action cannot recall a request already sent upstream. Reconcile its outcome. Portal cleanup cannot delete files saved to a customer's device or promise deletion in upstream systems.

Privacy requests and grievances go to support@primeserve.in. Admin cannot give consent on a customer's behalf. Handle account correction/erasure through support without exposing another user's information or requesting credentials.

REFERENCE

Release and operating checklist

Verify the deployed version before inviting customers.

Before go-live

1. Confirm the deployment includes customer login, QR, My Account, Admin and the current refund, access, pricing and consent features. This local manual is not proof of deployment.

2. Verify HTTPS, production customer mode, verified email sender and backend key configuration. Preserve production secrets.

3. Use an authorized test account for real email OTP, registration success, login/logout and mobile/tablet checks.

4. Check UPI/payee, company notification recipients and supplier state 10. Verify bank receipt before approving a test payment.

5. Verify one-time consent, withdrawal/re-consent, block/unblock with email, standard/special rates and report exports.

6. Verify GST source availability separately with authorization for chargeable tests. Check return ZIP, certificate PDF and challan JSON; fixture tests do not establish live source success.

7. Check worker, retention, backups and rollback readiness. Review unresolved holds/refunds before release.

Daily Admin routine

Review pending payments, refunds and uncertain API outcomes. Reconcile real bank receipts/transfers, examine failed notifications, export needed reports and investigate unusual activity. Log out when finished.

Customer handover

Confirm the customer knows where to see balance, submit payment UTR, confirm charges, find downloaded files, complete both refund steps and manage consent without repeated prompts.

> **Manual distribution**
> This guide contains no credentials or real customer records. Admin procedures should still be shared only with authorized staff. Recheck the guide whenever workflows change.

REFERENCE

Quick lookup and support

Common questions and essential terms.

Question	Where / answer
Customer adds money?	My Account > Add Money: scan QR, pay, then submit amount and UTR.
Admin approves recharge?	Payments > Approve or Reject a Recharge; verify bank receipt first.
Admin can add/subtract balance?	Yes: Add Balance, or Reduce Wallet Balance. Neither transfers bank money.
Block/re-enable a customer?	Customers > Block / Unblock, with reason and status email.
Standard price without changing special?	Pricing > Standard Service Prices; special rates remain protected.
Consent every time?	No. Once for stated purposes/version. Manage withdrawal/re-consent in My Account.
Admin approval for re-consent?	No. Customer can give consent again themselves.
Refund approval sends money?	No. Admin transfers manually, verifies success and records UTR.
Report above 100,000 records?	Dated Reports supplies all selected records as numbered Excel parts in a ZIP.

Essential terms

GSTIN: taxpayer identifier. **UTR:** external payment/transfer reference. **Hold/reservation:** funds temporarily unavailable to spend. **Special rate:** protected client/service price. **Consent:** affirmative recorded choice for stated purposes. **Job ID:** provider processing identifier, separate for each request.

Contacts and document control

Support, privacy and refunds: **support@primeserve.in**. Intended company payment notices: **primeserve45@gmail.com** and **finance@primeserve.in**, subject to allowed configuration. Never send credentials or OTPs.

Version 1.0 | 4 November 2026 | Primeserve Global Solution Private Limited. Checked against local customer/Admin views, controllers, accounting, downloads, email, refunds, worker and consent flows. Update this guide when these workflows change.
